APPLICANT: Proteom Ltd
TITLE OF INVENTION: Complementary peptide ligands generated from microbial genome seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 19, Application US/10271343

Publication No. US20030166003A1

GENERAL INFORMATION:

APPLICANT: Cochran, Andrea G.

APPLICANT: Stelton, Nicholas J.

APPLICANT: Stelton, Nicholas J.

APPLICANT: Stelton, Nicholas J.

TITLE OF INVENTION: A STRUCTURED PEPTIDE SCAFFOLD FOR DISPLAYING TURN LIBRARIES

TITLE OF INVENTION: ON PHAGE

FILE REFRERENCE: 1669.116011

CURRENT APPLICATION NUMBER: US/10/271,343

CURRENT FILING DATE: 2000-06-13

FRIOR APPLICATION NUMBER: US 69/592,695

FRIOR APPLICATION NUMBER: US 60/139,017

PRIOR APPLICATION NUMBER: US 60/139,017

FRIOR PILING DATE: 1999-06-14

NUMBER OF SEQ ID NOS: 60

SOFTWARE: PATENTIN Version 3.1

SEQ ID NO 19
                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

JSEQUENCE 10, Application US/09673763

Patent No. 6746676

Patent No. 6746676

JERNEAL INFORMATION:

APPLICANT: Oregon State University

TITLE OF INVENTION: Methods of use for infection-specific INCA, INCB, and

TITLE OF INVENTION: MCC proteins of Chlamydia

FILE REPERENCE: 52297

CURRENT APPLICATION NUMBER: US/09/673,763

CURRENT PILING DATE: 2000-10-16

PRIOR APPLICATION NUMBER: 60/082,588

PRIOR FILING DATE: 1998-04-21

PRIOR FILING DATE: 1998-04-21

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-09-341-461-2

Sequence 2, Application US/09341461

Sequence 2, Application US/09341461

Patent No. 658639

GENERAL INFORMATION:

APPLICANT: Hammond, Timothy G.

APPLICANT: Verroust, Pierre J.

TITLE OF INVENTION: Cubilin Protein, DNA Sequences Encoding Cubilin

TITLE OF INVENTION: and Uses Thereof

FILE REFERENCE: D6148

CURRENT PELLON NUMBER: US/09/341,461

CURRENT FILING DATE: 2000-07-20

PRIOR APPLICATION NUMBER: PCT/US99/01259

PRIOR APPLICATION NUMBER: PCT/US99/01259

NUMBER OF SEQ ID NOS: 40

SEQ ID NO 2

LENGTH: 3623

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                          Sequence 43, Application US/08549008

Sequence 43, Application US/08549008

Patent No. 5714310N:

GENERAL INFORMATION:

APPLICANT: Romoriya, Akira

APPLICANT: Romoriya, Akira

TITLE OF INVENTION: Compositions for the Detection of

TITLE OF INVENTION: Protease in Biological Samples and Methods of Use Thereof

WUMBER OF SEQUENCES: 56

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend and Crew LLP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 143, Application US/08802981

-i - PATHWAY. Azginine biosynthesis; third step.
-i - SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-i - SIMILARITY: Belongs to the NAGSA dehydrogenase family. Subfamily
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).

Lecubal J.C., resubako.

Lecubal J.C., vettore A.

Lectyl-D-glucosamine and N-acetylmuramic acid in peptidogly betteropolymers of the prokaryotes cell walls.

CC -!- SIMILARITY: Belongs to the glycosyl hydrolase 24 family.

Cendron A; s, Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human NGED (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

```
to cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

The condition or lymphangiogenesis in a mammal with a condition

Coharacterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery

Corebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid or mammal in peripheral limbs or in lungs, peritoned cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
  peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidiaing the cysteine residues. The monocyclic peptides (comprising 2 linked monocyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior

Detailed loop fragment from an exposed populate antiparation and peptide loop fragment from an exposed populate by continuous of peptides dimental by oxidising the cysteine residues. The monocyclic peptides, dimentic bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, crebenovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cremma, substance-induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to induced by vested and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by vested and lymphatic or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by vested vested a chronic inflammation with an anti-inflammatcry agent, to treat a chronic inflammation, expecially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;
                                                                                 The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta beta carbon separation distances on opposite antiparallel strands of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    characterised by angiogenesis, neovascularisation or lymphangiogenesis.

Characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumnour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, propertension induced neovascular permeability in a mammal (the mammal has a condition characterised by fluid accumilation in peripheral limbs or in lungs, peritoneal cavity, pleura, or sequelature. The monomeric and bicyclic peptides are used to interfere vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and a liboused in combination with an anti-inflammatory agent, to treat a least in the libouse and activity induced by VEGF, VEGF-C or -D and a libouse and libo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ï
                                                                                                                                                                                                                                                         The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, a contention or lymphangiogenesis in a mammal with a condition characterized by a monocyclic peptide with anglogenesis, and manned with a condition characterized by a measure of the content of the cyclic peptide with anglogenesis.
                                                                                                                    Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inflammation, especially rheumatoid arthritis, psoriasis and

The DNA is derived from Nocardia corallina and comprises 4 open reading frames. ORFs amoA and amoC encode subunits 1 and 2 of the alkene monoxygenase enzyme and ORF amoD encodes a reductase capable of transferring electrons from NADH coenzyme to a monoxygenase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR81469-R81472 are protein products of the Nocardia corallina strain B-276 alkene mono-oxygenase gene. The gene encodes 4 protein products amoA, amoB, amoC and amoD derived from the 3 different reading frames of the operon. The gene is useful for the production of indigo via oxidation of indole. Nocardia corallina can be cultured in a medium contg. indole and will readily oxidise the indole yielding indigo into the culture medium. E. coli may also be transformed with the alkene mono-oxygenase gene and used as above to efficiently produce indigo by microbial oxidation. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                          Alkene mon:oxygenase and corresp. gene - useful for the epoxidation of

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human very constant endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides of an a cyclic peptide by oxidising the cysteine residues. The monocyclic peptides dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one animo acid deleted prior to cyclisation are used to interfere with anglogenesis, neovascularisation or lymphanglogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphanglogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangloma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restences; head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related anglogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver
                                                                            ;

The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VBGF. VBGF.C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

The invention relates to novel foetal polypeptides encoded by polymucleotides comprising one of 477 sequences fully defined in the specification. The foetal polymucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a CDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue cDNA libraries

                         neovascularisation or lymphangiogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura,
                                                                                                                                                                                                                                                                                                                                                                                                                or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF-C or -D and are also used in combination with an anti-inflammarcry agent, to treat a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; foetal protein; cytostatic; immunosuppressive; immunostimulant; nootropic; neuroprotective; thrombolytic; osteopathic; antiinflammatory; gene therapy; antisense therapy; cancer; immune disorder; growth disorder; osteoporosis; thrombolytic disorder; netroprotes; thrombolytic disorder;

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGT) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations creponsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                          Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 20; SEQ ID NO 52759; 103pp; English.

and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New protein from Neisseria gonorrheae, useful for the manufacture of medicament for treating or preventing N. gonorrheae infection.
                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to proteins from Neisseria gonorrhoeae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a rat cubilin protein. Cubilin is a ligand-binding, epithelial glycoprotein receptor that facilitates uptake of intrinsic factor/vitamin Blz complexes in intestines and kidney. It is also involved in endocytosis and trafficking of light immunoglobulin chains in renal proximal tubule cells. Host cells containing a vector comprising the rat cubilin DNA sequence can be used for the recombinant expression of the protein. Cubilin, or its fragments, are used to treat or reduce toxicity, particularly in kidneys, spleen, brain, liver, heart and thyroid. Cubulin mutations may also be implicated in idiopathic proteinural, fetal malformation, poor fetal development and spontaneous abortions. Cubilin may also be used to raise specific antibodies, used for its detection, or clones that express it, in standard immunoassays. Fragments of cubilin DNA can also be used to detect cubulin mRNA in cell and tissues, by hybridization. Abnormal levels of cubilin in the urine are indicative of kidney damage. Sequences ANY27021-35 represent EGF repeat sequences of rat cubilin and from homologous regions of other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

```
This sequence represents novel infection-specific protein IncB of chlamydia psittaci strain GPIC. IncB is found in the inclusion membrane of infected cells. It is associated primarily with the vegetative reticulate body form of Chlamydia rather than with the refractile elementary body form. The invention includes: a vaccine directed against the reticulate body form of Chlamydia comprising 1 or more infection-specific proteins (see AAY3210-78), including IncA, IncB and IncC; methods of using and producing such a vaccine; methods for detection of infection-specific antibodies or antigens in a biological specimen; and a method of using therapeutic agents specifically directed against infection-specific peptides, or the genes that code for such peptides, treat, chlamydial infection. (Updated on 17-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sugiyama T, Otsuki T, Wakamatsu A, Sato H, Ishii S;

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the entire genome of cyanophage S-2L, and to the protein encoded by it. Genes isolated from the genome of S-2L are useful for preparing enzymes for synthesis of D-bases (D = 2,6-diaminopurine), particularly D, dDMP and dDTP, or polynucleotides containing these bases, polymerases involved in metabolism of D-bases and deoxynucleotide analogs, for chemotherapy of AIDS. The genes, and encoded polypeptides, can be used for detection and/or identification of S-2L, and for identifying agents that modulate synthesis of D-bases or polynucleotides containing them, and fusions of S-2L polypeptides with an antigen can be used to raise specific antibodies, useful for detecting S-2L. This sequence corresponds to one of the proteins encoded by the cyanophage S-
                                                                                                                                                                                                                                                                                                                                                   New genomic sequence for cyanophage S-2L, useful for identifying genes for synthesis of 2,6-diaminopurine bases or polynucleotides containing

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, immunologically assaying the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide with the antibody of the encoded by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polypucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide and encoded protein are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or medicines for requisition of their expression and activity, or as targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tunnours. The CDNA may be used to requiate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.
                                                                                                                                                                                                                                                                           polynucleotides and polypeptides, useful for developing a diagnostic ter or medicines for regulation of their expression and activity, or

are associated with carcinomas. The sequences are useful for: (i) for screening drug candidates; (ii) for screening of bioactive agent capable of bioactive agent capable of a bioactive agent capable of modulating the activity of CAP; (iii) for screening of evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vii) for inhibiting the activity of CAP; (ivi) for treating carcinoma; (viii) for neutralizing the effect of CAP; (ivi) for treating carcinoma; (viii) for neutralizing the effect of CAP; (ivi) for treating carcinoma; (viii) for modulating the effect of CAP; (ivi) for determing carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CAP. Note: This patent is an equivalent to basic patent US2002182586A1, for which no sequence data was published The present invention relates to novel DNA and protein sequences which

| Sequence 6, Application US/09815923
| Sequence 6, Application US/09815923
| Patent No. 6787642
| GENERAL INFORMATION:
| APPLICANT: Gill, Sarjeet S. |
| APPLICANT: The Regents of the University of California |
| TITLE OF INVENTION: Use of Insect Cell Membrane Transporters as No. 6787642el |
| TITLE OF INVENTION: Use of Insect Cell Membrane Transporters as No. 6787642el |
| TITLE OF INVENTION: Use of Insect Cell Membrane Transporters |
| TITLE OF INVENTION: Use of Insect Cell Membrane Transporters |

Patent No. 5587311

GENERAL INFORMATION:

APPLICANT: COBON, Stewart Gary
APPLICANT: WILLADSEN, Law Anthony York

APPLICANT: WILLADSEN, Peter

APPLICANT: KEMP, David Harold
APPLICANT: KEMP, David Harold

APPLICANT: RIDING, George Alfred
APPLICANT: RIDING, George Alfred

APPLICANT: RIDING, Keith No. 5587311man

TITLE OF INVENTION: DNA Encoding A Cell Membrane;

TITLE OF INVENTION: Glycoprotein Of A Tick Gut

NUMBER OF SEQUENCES: 71

CORRESPONDENCE ADDRESS:
         60042/111 BIAU
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          UMBER: AU PH9196
